

No Selected Records - Tip #46

Have you ever wondered why when you open a table for the first time there are no records available?

This will also happen when you move to another table and move back. The reason is that each table has a record set called **Current Selection**. When the user first enters a table, the set is empty until some action is performed. Then when the user leaves the table (to go to another), the Current Selection is emptied. The setting *Remember Last Selection...* in the Preferences allows the user to keep the last selection in a table in the Current Selection. Therefore, when the user returns to the table, the last set that was worked with will still be there.
